VPN error codes

VPN-801 Sign-in not approved

The VPN sign-in was not approved in the authenticator app within 60 seconds. Open the company authenticator app, approve the request, and connect again. If no request appears, check that your phone has a data connection.

VPN-806 Certificate missing

The VPN client cannot find a VPN certificate on this laptop. This usually happens after a laptop is rebuilt. Raise a ticket to have a new certificate issued; it takes about 1 business day.

VPN-809 Certificate expired

The VPN certificate on this laptop has expired, so the VPN cannot connect. Renew the certificate from the self-service portal while connected to the office network, or call the service desk to renew it remotely.

VPN-812 Session time limit reached

The VPN session reached its maximum length and was disconnected. Sign in again with MFA to start a new session. This is expected behaviour, not a fault.

VPN-815 Connection from a restricted country

The VPN connection was blocked because it came from a country on the restricted list. Contact the security team; access can only be opened after they approve your travel.

VPN-820 Device health check failed

The endpoint agent on this device is missing or not reporting as healthy, so the VPN refused the connection. Update the endpoint agent from the software catalogue and restart the device.

Network, Wi-Fi and account error codes

NET-2231 Destination blocked by firewall

The firewall blocked the website or service you tried to reach. If you need it for work, raise an access ticket with the full address and the business reason. Do not try to bypass the block.

NET-2240 Name lookup failed

Your laptop could not look up the address of the service (a DNS failure). Restart the laptop. If it continues, run `ipconfig /flushdns` from a command prompt and try again.

WIFI-102 Corporate Wi-Fi rejected the device

The CORP-SECURE network rejected the connection because the laptop does not have the company Wi-Fi profile. Connect by cable or to the guest network, then reinstall the Wi-Fi profile from the software catalogue.

WIFI-117 Guest access expired

Guest Wi-Fi access lasts 8 hours. After that the guest must register again at the reception kiosk to get a new code.

ACC-401 Account locked

The account was locked after too many failed sign-in attempts. It unlocks automatically after 15 minutes, or the service desk can unlock it sooner after checking your identity.

ACC-409 Password expired

The password reached its maximum age and must be changed before you can sign in. Change it from the self-service portal; the new password must follow the password policy.

PRN-310 Print job stuck in the queue

A print job is stuck and is blocking the jobs behind it. Cancel the job from the print queue window, then send it again. If the queue will not clear, raise a P3 ticket.
